

Fig. 17. Area of home range used by the cows for 50% of the time as determined by kernel analysis on the two fields in (a) absolute area and in (b) as percentage of that available. Area used in Sulber is in blue and that in High Brae in green. The horizontal line in each column represents the median, the extent of the box denotes the interquartile range and the error bars the 95% confidence limits.

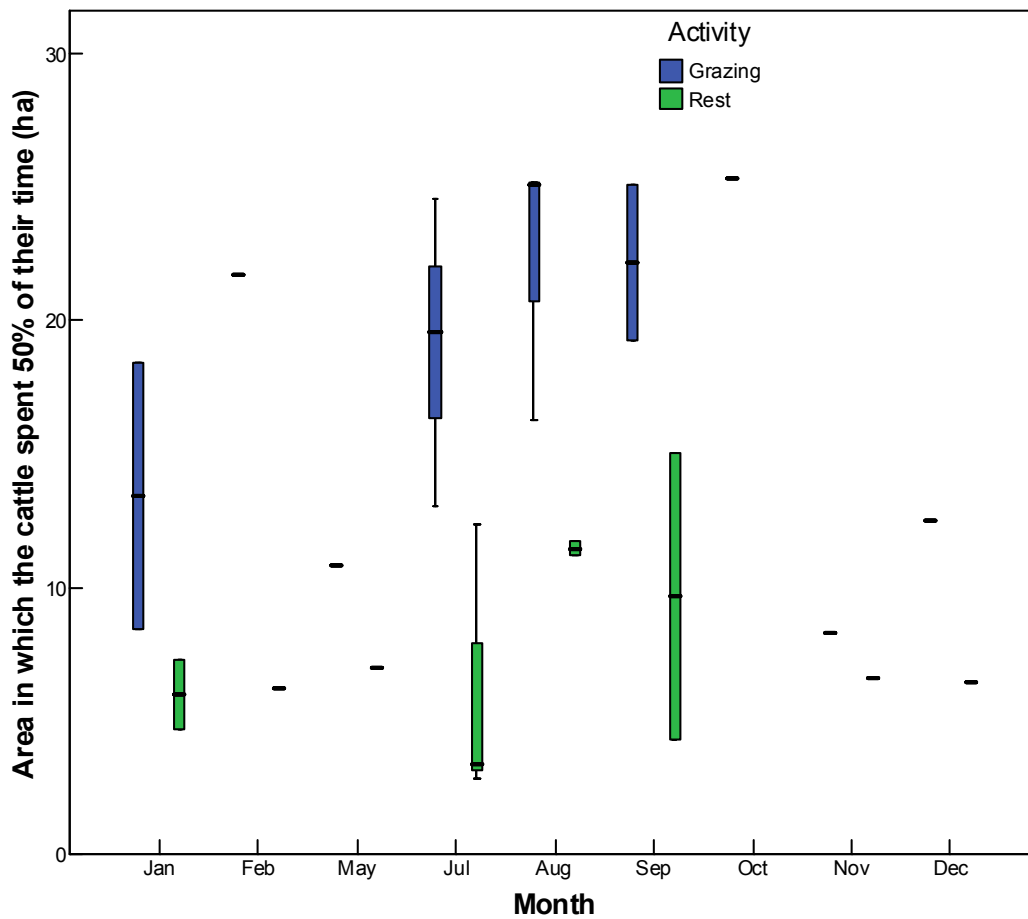

Fig. 18. Area of home range used by the cows for 50% of the time as determined by kernel analysis at different months of the year. Area used by grazing cattle is in blue and that resting cattle in green. The horizontal line in each column represents the median, the extent of the box denotes the interquartile range and the error bars the 95% confidence limits. Note that for some months only a single animal was monitored
